Your 30-Day Diabetes Management Plan

Evidence-Based · Nigerian Foods · Islamic Medicine

"And when I am ill, it is He who cures me."

— Ash-Shu'ara 26:80

Clinical Recommendation

This plan is built from peer-reviewed research and adapted for Nigerian foods and lifestyle. Standard of care for Type 2 diabetes includes a current HbA1c, kidney function panel, eye examination, and medication review. Please share this plan with your physician before starting.

"Make use of medical treatment, for Allah has not made a disease without appointing a remedy for it, with the exception of one disease — old age."

— Prophet Muhammad ﷺ · Abu Dawud 3855

What Is Happening in Your Body

Type 2 diabetes means your cells have become resistant to insulin — the key that unlocks them to receive glucose from the blood. Glucose then accumulates in the bloodstream instead of entering your cells for energy. Over time, this excess glucose damages blood vessels, nerves, kidneys, and eyes.

[+ Why this matters urgently](#)

Your 30-Day Roadmap

Week 1–2: Remove blood sugar spikes — stabilise the foundation

Week 3: Add flaxseed, bitter leaf tea, longer walks — deepen insulin sensitivity

Week 4: Consolidate — blood sugar stabilises measurably

After 30 days: HbA1c & fasting glucose test — watch the numbers move

The 3 Non-Negotiables

1 No sugar-sweetened or carbonated beverages — these spike blood glucose faster than almost any food

2 Black seed oil every morning — clinically proven to reduce fasting glucose and HbA1c in Type 2 diabetes

3 A 20-minute walk after the largest meal of the day — proven to reduce post-meal glucose spikes independently of medication
